Rechercher plutôt kls glass shattering a physical or chemical change

Aperçu généré par IA

Shattering glass is a **physical change**. The process changes the size, shape, and form of the glass, but it does not create a new substance or change the chemical makeup of the material. The tiny shards are still glass. CK-12 Foundation +3

Why It Is a Physical Change

- **No New Matter:** The atoms and molecules stay bonded in the exact same way.
- **Altered Appearance:** Only the size, form, and surface area change.
- **Same Chemical Properties:** The broken pieces react to other chemicals the exact same way an unbroken glass would. Quora +2

If you'd like, I can give you more examples of **physical versus chemical changes** or explain how glass is recycled.
